[ϕ]free = 6.25×10^6 = 27%

[B] = 10^8

in B_φ : ϕ = 4.7×10^4

ϕfree = 1.47×10^4 = 31%

ϕads/B ~ .17

The same with ϕ in excess, same B_I, all operations 2' later.

adsorption { 0, 5.3

.1 cc ϕ → .9 cc B_I = B_ψ

.02 cc B_ψ → 1 cc broth cf tube

dilutions

cf 4', m : 2×10^3 11 - 259, 12 - 246

.02 cc → 1 cc broth in cf. tube, B_ψ

desorption { 7.5, 13

B_ψ : 50 13 - 329, 14 - 449

B_ψ cf 4', m : 50 15 - 208, 16 - 245

in B_ψ : ϕ = 4.7×10^8

ϕfree = 2.52×10^8 = 53%

B = 10^8

in B_ψ : ϕ = 1.9×10^5

ϕfree = 1.13×10^5 = 60%

ϕads/B ≈ 2.2

Results: Small amount of desorption is well within the experimental error.

Percent adsorption ~ 1/2 in case of multiple infection than in case of B excess.

Desorption is less than in other experiments. This may be on account of all adsorption tubes being cooled under running tap water.
