Dear Josh:

Could I promote a constitutive Luc. strain? We are pretty certain that K-12 differs from Monod's in that the basal level in K-12 appears to be a minimal unit of lactase/cell rather than simply the presence of constitutives — & furthermore adaptation appears homogenous in K-12 rather than heterogenous as Benzer found. However we need a constitutive Luc ~~+~~ & have been unable to pick one up. Thus if

you could send a transfer
of yours we would
appreciate it.

You might be interested
to know that gy-52 does
not do not be a lac-
mutant. The best dope we
can get on it suggests
it's a permeability mutant -
with the permeability affecting
glucose as well as lactose.
We do however, have
a complete lac strain -
no enzyme under any
circumstances.

I understand you are
now a home & estate
owner - congratulations

Best regards
as ever
Dave
