Madison, Wisconsin

Dear Joshua,

I am sending you some phages, including T2L (for Luria) and T<sub>4</sub>D (for Doermann), along with our E. coli S, a smooth strain sensitive to all the phages. It has no particular advantage over B except that it makes nice white plates.

Our E. coli H, which I am not sending, is useful only with my variety of T2 (T2H) and is resistant to T<sub>4</sub>.

Congratulations for the unification of protoplasts and L forms.

Sincerely,

A. D. Hershey
