Nov. 4,1947

Dr. Link,

These are the compounds I had in mind for the initial tests anyhow:

a- and b- methyl galactoside ✓

allo-lactose (β-6-glucose galactoside). ✓

iso-maltose (an acre of Mars!) Not that essential ✓

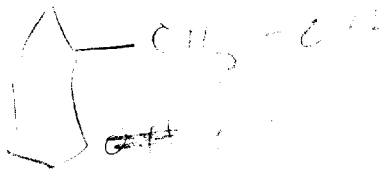
a- and b- phenyl gluco- and galacto- sides

do. o-hydroxyphenyl.

b-methyl fructoside (fructofuranoside).

a- and b- methyl d-xyloside

b-methyl l-arabinoside ∝!!

The problem is to determine what configurations are covered by mutations selected on lactose, maltose etc.


Joshua
