Dear Dr. Nathans,

Lionel Crawford and I have recently developed a procedure for strand separation of Form ^{II} SV40 DNA which utilizes synthetic polynucleotides as per Szybalski. We are planning to study single stranded viral DNA in a coupled in vitro protein synthesis system and would very much like to do experiments with a unique population of linear molecules. Your recent observations with the B-restriction enzyme of E.coli suggests that it could provide such a population of DNA molecules. Would it be possible to obtain from you a sample of the B-enzyme for use in our system. Should you be able to spare a sample we will be happy to cover all transportation expenses.

Thanking you in advance.

Yours sincerely,

David Ward

D. Ward.
